SUMMARY

As a Data Engineer with 1.4+ years of experience in developing and optimizing data-driven analytics and automating solutions, I actively Seeking an entry-level Data Analyst or Backend Engineer role to apply cloud-based data processing and automation skills using Python, SQL, and AWS.

WORK EXPERIENCE

Cloud4c Services Pvt Ltd Associate Engineer	Hyderabad, Telangana, India. May 2022 – Aug 2023
- Promoted from Associate Engineer (L0) to Engineer (L1) for contributions to development and automation. - Developed and optimized Django applications; automated workflows using Python to reduce system load. - Built and deployed Python-based automation scripts via Git and AWS, improving CI/CD pipelines and release cycles.	
Catholic University of America Research Support Assistant (Statistics)	Washington, DC May 2024 – Oct 2024
Worked at the university as a Statistical Analyst, assisting in data collection, cleaning, and analysis for academic research projects. Used tools like Excel, SPSS, and Python to generate insights, create visualizations and support faculty with statistical reporting.	

EDUCATION

The Catholic University of America Master's Degree in Data Analytics	Washington, DC May 2025
Telangana University Bachelor's in computer science	Kamareddy, Telangana May 2021

TECHNICAL SKILLS

Programming Languages: Python, Java, JavaScript, SQL, R
Frameworks & Libraries: Django, Django REST Framework (DRF), Spring Boot, Pandas, NumPy, Scikit-learn, Matplotlib, Seaborn
Web & API Development: RESTful APIs, JWT Authentication, Swagger/OpenAPI, Microservices Architecture
Frontend Skills: HTML, CSS, JavaScript (React.js / basic)
Databases: PostgreSQL, MySQL, MongoDB
Cloud & DevOps: AWS (S3, Lambda, Glue, Redshift), Apache Airflow, Git, GitHub, CI/CD, Heroku, Docker
Data Visualization: Power BI, Tableau

PROJECTS

MyShift - ITSM Ticketing Tool	Cloud4c Services, Hyderabad
- Developed a customized ticketing system to optimize issue tracking, SLA management, and ticket lifecycle management for multiple clients using Python, Django, and RESTful APIs. - Designed a multi-tenant database architecture using PostgreSQL and MongoDB to support diverse client requirements and services. - Implemented real-time alert systems and notifications for ticket escalations, SLA breaches, and high-priority issues, leveraging AWS for scalability and reliability. - Streamlined ticket handling and resolution processes through efficient Standard Operating Procedures (SOPs).	
Bookstore Management Platform – Secure API with Django	
- Developed a scalable backend system using Django microservices to manage books, users, orders, and payments. - Implemented JWT-based authentication for secure user access and role management. - Designed and tested RESTful APIs with full CRUD functionality for each service. - Integrated Swagger for auto-generated API documentation, enhancing developer experience. - Utilized Django ORM aggregations to compute top-selling books and monthly sales revenue. - Simulated payment workflows and order status updates to mimic real-world e-commerce scenarios. - Containerized the application using Docker for consistent development and deployment environments. - Deployed the application on Render, making it accessible for live demonstrations.	
Capstone Project - 911 Emergency Call Data Analytics & Forecasting Dashboard	Jan 2025 – Apr 2025
- Analyzed over 99K emergency call records using Pandas, NumPy, and Seaborn to uncover temporal-spatial trends by time, location, and call reason (EMS, Fire, Traffic). - Engineered time-based features (Hour, Month, Day) and visualized trends through group-by analysis, heatmaps, and cluster maps. - Developed an interactive Tableau dashboard with bar, line, and heatmap charts, KPI tiles, and filters (Zip, Day, Reason, Township) for dynamic exploration of 130K+ records. - Built classification models (Random Forest) to predict emergency call types and used Prophet for call volume forecasting and peak-hour classification.	
Cloud-Native E-Commerce Data Lakehouse	
- Designed a cloud ETL pipeline using AWS Glue (PySpark) to process simulated e-commerce data into partitioned Parquet files on S3. - Implemented SCD Type 2 logic in Amazon Redshift to track historical changes in dimension tables (customer, product). - Automated job orchestration and error handling using AWS Step Functions and Lambda for reliable data pipeline execution. - Enabled analytics-ready reporting via materialized views, SQL validations, and quality checks to enhance business insights. - Simulated realistic e-commerce domains including customers, products, orders, and transactions to reflect production-scale. - Demonstrated data Lakehouse architecture with integrated storage, transformation, orchestration, and warehousing.
